Syspine VoIP Phone System is Breakthrough for Small Businesses *Microsoft Response Point Phone System Software Centers on Voice Recognition Technology*

(RENO, Nev., March 5, 2008) — A new, IP (Internet Protocol) phone system made especially for small businesses that delivers ease of use, low costs and integration with other technologies, is now available. The award-winning Syspine™ Digital Operator Phone System from Quanta Computer is an advanced IP PBX system that features Microsoft® (Nasdaq: MSFT) Response Point™ phone system software. The complete Syspine system can be purchased directly at www.cmpptel.com, the online home of Syspine's authorized distributor, Call Management Products.

Designed specifically for companies with one to 50 employees, Syspine features a powerful voice-recognition system that can be linked with a company's internal phone directory, as well as an individual's Microsoft Office Outlook® address book.

Cited for "excellence while addressing real needs in the marketplace," the Syspine Digital Operator Phone System was recently lauded as Product of the Year by *Internet Telephony* magazine, which has been serving the VoIP industry for the past decade. Syspine has also received the prestigious Innovators Award from *VON Magazine*, which recognizes companies that represent the future of IP communications.

Ease of Installation and Use

Because the system was specifically designed for small businesses to minimize the involvement of IT staff or tech support, the Syspine system is highly intuitive for easy learning and operation. No extensive training is necessary for the system, which can be set up in a matter of minutes. In addition, new users may be added, moved or changed with only a few mouse clicks. As many as 50 individual users can be included in any given Syspine system.

-more-

On their own, individuals can quickly and easily change preferences for voicemail and call handling, as well as utilize their own Microsoft Office Outlook directories to create a custom call distribution list. They can also forward office extensions to external lines, park and retrieve calls and messages, and send voice mail to e-mail.

Systems, which can be modified locally or remotely without onsite support, can also be configured to bypass receptionists to ring specific individuals or departments, as well as ring all the phones in a given department at once (i.e. new orders, or customer service).

Programming manuals and laborious key strokes have been eliminated with the powerful voice-activated user interface. The user simply presses the access button and says, "Call John Smith in shipping;" or, "Transfer to customer service;" or, "Call Mary Jones' cell phone," and the system does the rest. Transferring, parking and retrieving calls are similarly voice-activated.

In addition to Outlook, the Syspine system is compatible with Microsoft Windows® Address Book (Windows XP), Windows Contacts (Windows Vista) and Microsoft Office Outlook with Business Contact Manager.

The Hardware

The Syspine Digital Operator A50 is a single solution device that will connect up to eight standard telephone lines; it features a high-end, server-grade, fan-less design and can be installed anywhere. Businesses can add up to 50 individual Syspine IP310 business phones to create a complete, integrated small business phone system with no additional licensing fees.

Companies can order the Syspine Digital Operator Phone System and Microsoft Response Point phone system software directly at www.cmpitel.com. For more information, call 1-877-4ASYSPINE (1-877-427-9774) or visit www.syspine.com.
